Pharmaceutical Solutions and Dispersions

- Solubility and Dissolution**

Solubility determines the extent to which a drug can dissolve in a solvent, affecting bioavailability. Factors influencing solubility include temperature, pH, and the presence of other solutes.

Dissolution: The process by which a solid substance becomes dispersed in a solvent to form a solution. Governed by Fick's law of diffusion, it impacts the rate at which a drug becomes available for absorption.

Application: Enhancing solubility through salt formation, particle size reduction, or the use of solubilizing agents.
