First Law of

Thermodynamics The First Law states that energy cannot be created or destroyed, only transferred or converted. Mathematically expressed as: $\Delta U = Q - W$ Where: ΔU = Change in internal energy Q = Heat added to the system W = Work done by the system This law applies to closed systems and is fundamental in analyzing energy transfer during processes like heating, work, and phase change.

Second Law and Entropy The Second Law introduces entropy (S), a measure of disorder or randomness. For a reversible process, the change in entropy is given by: $dS = \delta Q_{\text{rev}} / T$ In practical applications, the second law helps determine the maximum possible efficiency of engines and refrigerators.

Important Formulas in Thermodynamics CSVTU Notes

Enthalpy: $H = U + PV$

Clausius Statement: Heat cannot spontaneously flow from a colder to a hotter body.

Carnot Efficiency: $\eta = 1 - (T_L / T_H)$

Work done in Boundary Work: $W_b = \int P dV$

Entropy Change for Ideal Gas: $\Delta S = C_p \ln(T_2/T_1) - R \ln(P_2/P_1)$

Modern Physics Modern physics introduces concepts beyond classical physics, including quantum mechanics and relativity. Photoelectric Effect Light incident on a metal surface ejects electrons if the frequency exceeds a threshold. Supports particle nature of light; explained by Einstein using quanta of energy ($E = hf$). Radioactivity Disintegration of unstable nuclei emitting alpha, beta, or gamma rays. Half-life: time taken for half the nuclei to decay. Nuclear Physics Involves fission, fusion, and applications in energy generation. Formulas and Constants to Remember Having a quick reference to important formulas helps in solving problems efficiently.
